

## **HF100 / 200 Fixing Bolt Guide**

The HF100/200 Current Shunts are connected into a circuit via an M10 bolt, extreme care should be taken when making these connections as shown by the warning label on the side of each housing. See below

The connection should be made using two 17mm spanners as shown below so that adequate torque can be applied to the fixing bolt without transferring excessive turning force to the connection stud.
